                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This branching enzyme is derived from B.stearothermophilus and is encoded by the glgB gene. It is stable at high temps. and can be produced in large amts. using recombinant techniques. It is a transferase allowing formation of alpha(1-6) branches in starch-like substances. It is useful for extending the shelf life of such materials and can be used in the prepn. of human and animal foods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4 FGGNIEKNKGI----FKLWAPYVNSVKLKLS-----KKLIPMEKNDEGFFEVEIDDIEE 53

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence encoding this protein may be contained in a recombinant plasmid. The heat-resistant pullanase can be produced in large amts. using a suitable host.
Plasmid pTPI contg. the pullanase gene (Japan Patent Apppln. No. 174037/88) was cleaved by various restriction enzymes and inserted into plasmid pV118/119. Single-stranded DNA was prepd. using helper phage M13K07 and the base sequence determined by the dideoxy method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           52 EENLTYSYII---EDKREIPDPASRYQPLGVHDKSQLIRTDY-QILDLGKVKIE----- 101

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

A) Residues: 1-558 A) CROSS-references: DDBJ:D64130; NID:g987702; PIDN:BAA11010.1; PID:g1838936
A) Cross-references: DDBJ:D64130; NID:g987702; PIDN:BAA11010.1; PID:g1838936
A) Experimental source: strain KM1
C) Comment: This enzyme hydrolyzes starch alpha-1,4 linkage adjacent to the alpha-1,1
C) Superfamily: trehalose trehalohydrolase
C) Keywords: glycosidase; hydrolase
                                                                                                                                                                                                                                                                                                                                                                                               enzymes from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              299
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         300

N.Antile: Organizational characteristics and information content of an archaeal ge
A.Title: Organizational characteristics and information content of an archaeal ge
A.Tatle: Organizational characteristics and information content of an archaeal ge
A.Accession: S73087
A.Accession: S73087
A.Status: nucleic acid sequence not shown; translation not shown
A.Molecule type: DNA
A.Residues: 1-561 c.SEN>
A.Cross-references: EMBL:V08256; NID:g1707679; PIDN:CAA69503.1; PID:g1707699
A.Experimental source: strain P2
A.Mote: the nucleotide sequence was submitted to the EMBL Data Library, September C.Superfamily: trehalose trehalohydrolase
C.Keywords: glycosidase; hydrolase

maltooligosyltrehalose trehalohydrolase - Arthrobacter sp. (strain Q36)
c; Species: Arthrobacter sp.
A; Variety: strain Q36
c; Date: 28-Oct-1996 #sequence_revision 13-Mar-1997 #text_change 20-Jun-2000

Maruta K., Hattori K., Nakada T., Kubota M., Sugimoto T., Kurimoto Cloning and sequencing of trehalose biosynthesis genes from Arthrobacter sp. 036.";
Biochim. Biophys. Acta 1289:10-13(1996).
-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(1->4)-D-glucosidic linkage in 4-alpha-D-((1->4)-alpha-D-9lucanosyl)n trehalose to yield trehalose and alpha-(1->4)-D-glucano.
-!- PATHMAX: Trehalose biosynthesis.
-!- PATHMAX: TELONOS TO FRAMILY 13 OF GLYCOSYL HYDROLASES, ALSO KNOWN AS THE ALPHA-AMYLASE FAMILY.

Submitted (DEC-1997) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(1->4)-D-glucosidic
linkage in 4-alpha-D-[(1->4)-alpha-D-glucanosyl](n) trehalose
yield trehalose and alpha-(1->4)-D-glucan.
-!- PATHWAY: Trehalose biosynthesis.
-!- SIMILARITY: BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO

Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.
--- CATALYTIC ACTIVITY: Hydrolysis of alpha-(1-74)-D-glucosidic
linkage in 4-alpha-0-!(1-74)-alpha-D-glucanosyl)(n) trehalose
yield trehalose and alpha-(1-74)-D-glucan.
--- PATHWAR: Trehalose biosynthesis.
--- STMILARITY: BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO
KNOWN AS THE ALPHA-AMYLASE FAMILY.
                                                                                               01-0CT-1996 (Rel. 34, Last sequence update)
16-0CT-2001 (Rel. 40, Last annotation update)
Malto-oligosyltrehalose trehalohydrolase (EC 3.2.1.141) (MT)
Malto-oligosyl trehalose trehalohydrolase)
(Maltooligosyl trehalose trehalohydrolase)
TREZ OR RV1562C OR MT1613 OR MTCY48.03.
